Project Abstract

This proposal seeks to protect and enhance habitat through fee title acquisition of key parcels in the Lower Root and Lower Zumbro Rivers. This effort is part of a broad partnership focused on improving habitat quality and connectivity in critical areas along the Mississippi River corridor.

Project Narrative

Design and scope of work

Problem to address:

The Mississippi River, once one of our nation's most diverse ecosystems, has been degraded. Historically, the Mississippi from the Twin Cities to the Iowa border was an important travel corridor that attracted many cultures with its abundance of timber, fish and game, fertile prairies, floodplain wetlands, adjacent bluffs, and clear and numerous spring-fed streams. For centuries, native cultures traveled, camped and lived along this magnificent reach of river. In the mid 1800's, however, European settlers arrived and forever changed the landscape by logging forests, converting prairies to farmland, channelizing and constructing levees along the tributaries, building cities and towns, and constructing wing dams and other structures for navigation.

Major tributaries, including the Root River and Zumbro River were channelized and levied in their lower reaches near the Mississippi River in the early 1900's, isolating them from their floodplains except during high water events. Forests, wetlands, and prairies behind the levees were converted to agriculture or urban uses. Over 15,000 acres of native habitats were lost, fragmenting the natural habitat corridors that connected the Mississippi River to its tributaries and their watersheds that were essential to the many species of fish and wildlife that roamed this area. This was especially damaging to high quality wetlands that were found in these floodplains.

Construction of locks and dams in the 1930's changed the river into a series of navigation pools. Pools 1 (Minneapolis) through 9 (MN/IA border) are located in Minnesota. Initially, these pools increased marsh and wetland areas, creating numerous islands and deep backwaters. Fish and wildlife were abundant, with waterfowl hunting and fishing in the backwaters world renowned. Over time, however, the pools began filling with sediment and wind and boat waves eroded away islands. Increased drainage and turbid water runoff from southern Minnesota tributaries (especially the Minnesota River), along with urban pollution from the Twin Cities caused the reach from the mouth of the Minnesota River to Lake Pepin to become very turbid and nearly void of dissolved oxygen. By the 1960's, few fish were able to survive, aquatic vegetation nearly disappeared, and hunting, fishing, and other recreational opportunities in the river above Lake Pepin were almost non-existent.

The Clean Water Act in the 1970's helped reduce point source pollution, resulting in improved water quality and subsequent improvements to some fish and wildlife species. While conditions have improved from their worst levels, there remain serious problems. Sediment from non-point sources continues to be a detriment throughout this reach, currently filling Lake Pepin at a rate nearly ten times greater than occurred historically. Lake Pepin is now the sink for nearly 900,000 metric tons of sediment per year, mostly from the Minnesota River. At the current rate

of filling which is equivalent to one city block covered with 100 feet of sediment each year, Lake Pepin will fill in just 300 years. The channels and backwaters along this reach (Twin Cities to Lake Pepin) remain one of the most degraded sections of the entire Upper Mississippi River System (Minneapolis to the mouth of the Ohio River).

Floodplain forests and oak savannas have also been impacted. Where the Vermillion and Cannon Rivers join the Mississippi, considerable state, federal, and private lands create one of the largest contiguous blocks of forest near a metropolitan area in the entire Mississippi River basin. These forests have been impacted by encroachment, invasive species, lack of floodwater scouring (resulting in reduced tree regeneration), and artificially high water levels from the locks and dams. Forest stand diversity (age and species of trees), along with interior forest birds that need large blocks of intact forest, have declined.

Combined these changes have resulted in the loss or degradation of approximately 700,000 acres (60%) of native prairie, wetland, and forest in the blufflands region of southeastern MN, which includes the 170 mile reach of the Mississippi River from the Twin Cities to the Iowa border. Fish and wildlife populations have suffered, with 82 species now considered rare, threatened, or endangered. The Minnesota State Wildlife Action Plan lists more species in greatest conservation need for the blufflands subsection than for any other subsection in Minnesota.

Scope of work:

The Lower Mississippi River Habitat Partnership includes over 20 agencies and organizations that have been working together to solve these problems. Each year a proposal is submitted to LSOHC that identifies specific projects that represent immediate opportunities for habitat protection, enhancement or restoration along the Mississippi River corridor. For the fiscal year 2012 proposal, acquisition and protection of floodplain forest and wetland will be completed on one parcel totaling 100 acres along the Lower Zumbro River, and one parcel totaling 358 acres near the Lower Root River. These are high priority sites that will connect to existing state owned lands, and will supplement habitat protection and enhancement of Root River parcels acquired through permanent conservation easements as part of the recently funded Natural Resource Conservation Service Upper Mississippi River Basin Initiative.

Setting priorities:

Partners work cooperatively to implement state, federal, and local programs and projects through a variety of funding sources. Overall priorities are set by the partnership based upon the level of biodiversity significance, proximity to existing state or federal lands, and current opportunities with willing landowners. This effort compliments the recent NRCS decision to spend over \$8 million on permanent wetland conservation easements in the Root River watershed, with the Lower Root River area one of the top priority sub-watersheds.

Urgency and opportunity:

Without these actions, life history needs will not be met for important bird, fish, and other wildlife species that depend on large tracts of intact and healthy forests, wetlands, rivers, and prairies. Game species will benefit with increased habitat for deer, turkeys, pheasant and other important species. Rare species will especially benefit from increased habitat and greater connectivity. Protection will also prevent the habitat degradation and soil erosion that would result from urban developments in this fragile region.

There are immediate opportunities for fee title acquisition of floodplain lands in the Lower Root and Zumbro Rivers. Landowners have been working with field managers from the various partners and are interested in selling. Without state funding, these parcels are likely to be sold to private parties for agricultural or other uses.

Habitat benefits:

These parcels will add to the protection and enhancement of existing forests and wetlands in the Lower Zumbro and Root River floodplain areas. Conversion of agricultural lands in flood prone areas to wetland or forest is an important objective of the overall effort. This will have direct benefits to fish and wildlife by increasing the size and connectivity of critical habitat. Increased numbers of game and non-game species will result as habitat area increases.

Stakeholder opposition and involvement:

The Lower Mississippi River Habitat Partnership includes over 20 organizations and agencies working along the Mississippi River corridor. Combined, these partners have a large constituent base and are working closely with landowners, local governments, watershed districts, non-government organizations and other interests on natural resource issues. Support for conservation through easements and fee title acquisition is generally high, however, some concerns remain within county governments regarding Payment in Lieu of Taxes.

Planning

Relationship to other plans:

This proposal helps meet the goals and objectives in the Minnesota Conservation and Preservation Plan by focusing on the acquisition of shorelines in southeast Minnesota (page 74). This effort will restore wetlands, forests, and prairies and protect critical shorelines of major tributaries and the Mississippi River main stem. LSOHC Section priorities for the Southeast Forest Section will be met by restoring Mississippi River tributary rivers to their floodplains, increasing the size of habitat complexes, supporting rare species, and expanding the Richard J. Dorer Memorial Forest.

It also meets the goals and objectives of a variety of regional, statewide, and basin-wide plans including: MN State Wildlife Action Plan; 50-year Conservation Vision; Richard J. Dorer Memorial Forest Acquisition Plan; The Nature Conservancy Zumbro/Weaver Dunes and Root River Conservation Action Plans; Lower Cannon River, Root River, Zumbro River, Lower Vermillion River, and Lake Pepin Total Maximum Daily Load (TMDL) studies; Metro Greenways Conservation Corridors; Mississippi Makeover Project; Vermillion River Watershed Management Plan; Basin Alliance for the Lower Mississippi in Minnesota (BALMM) Basin Plan Scoping Document; Zumbro River Watershed Management Plan; County Local Water Plans; River Resources Forum's Mississippi River Environmental Pool Plans; Upper Mississippi River National Wildlife and Fish Refuge Comprehensive Conservation Plan; Upper Mississippi River Conservation Committee "A River that Works and a Working River"; US Army Corps of Engineers Habitat Needs Assessment; UMR-IWW System Navigation Feasibility Study; and

Minnesota Forest Resource Council Landscape Plans for the Blufflands Subsection. Many of the actions recommended in these plans have been successfully used in other areas along the Mississippi River. By meeting these goals, protection and restoration of the Mississippi River corridor will ensure a healthy floodplain ecosystem and abundant populations of fish, game, and wildlife.

Science based planning approach:

While the US Fish and Wildlife Service's Strategic Habitat Conservation Model (SHC) was not used specifically, all of the projects in this proposal are based on scientific understanding and models developed for other purposes. The plans and models used to develop this proposal include partnering and adaptive management which are fundamental to the intent, and in the spirit of the SHC model.

Relationship to Other Constitutional Funds

This partnership will benefit primarily habitat, however, there will be significant secondary benefits for clean water. Any related efforts will be coordinated with other funding sources, such as Clean Water Council and LCCMR.

Relationship to Current Organizational Budget

This program does not supplant existing budgets. Funding would allow acquisition of additional WMA and State Forest lands.

Sustainability and Maintenance

Maintenance will be completed by partner agencies as part of their normal management schedule. For state owned lands, it will be primarily the responsibility of the MN Dept. of Natural Resources.

Types of Projects

Fee Acquisition Projects

Will local government approval be sought prior to acquisition?

X Yes No, please explain not applicable

If no, please explain here:

Is the land you plan to acquire free of any other permanent protection?

X Yes No, please explain not applicable

If no, please explain here:

Easement Acquisition Projects

Will the eased land be open for public use?

Yes No, please explain not applicable

If no, please explain here:

Will the conservation easement be permanent?

Yes No, please explain not applicable

If no, please explain here:

Restoration and Enhancement Projects

Is the activity on permanently protected land and/or public waters?

X Yes No, please explain not applicable

If no, please explain here:

Does the activity take place on an Aquatic Management Area (AMA), Scientific and Natural Area (SNA), Wildlife Management Area (WMA), or State Forests?

X Yes, which ones No, please explain not applicable

If so, please indicate which ones: This proposal includes both WMA's and State Forests.

Accomplishment Timeline

[Provide a timeline that tracks the program components with milestones and dates. The accomplishment timeline should align with the scope of work and budget.]

Activity	Milestone	Date
Fee title acquisition 2 parcels	Complete acquisition	6/30/2013
Enhancement of acquired parcels	Complete enhancements	6/30/2014
